                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAs) that encode them.

(I) have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumour associated proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the NAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA molecules may be administered to down regulate protein expression by

binding with the cells own genes and preventing their expression. The NA and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar NA sequences in samples, and hence which patients may be in need of treatment for lung cancer. The (1) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the protein. AAF68083 to AAF68083 and AAB76818 to AAB76878 represent human lung tumour protein related nucleotide and protein sequences which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; lung cancer; lung tumour; lung tumour protein; gene therapy; lung cancer antigen; lung tumour-specific antigen; diagnosis; vaccine; cytostatic; antisense inhibition; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        qq
                                                                                                                                                                                                                            The present invention describes immunogenic portions of lung tumource associated proteins (1) and the nucleic acids (NAs) that encode them.

C (1) have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumour-associated flagnosis of diseases associated with their imappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (1). Additionally, the NAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA concleudes may be administered to down regulate protein expression by binding with the cells own genes and preventing their expression by concleudes may be administered to down regulate protein expression by binding with the cells own genes and preventing their expression of assays to detect and quantitate the presence of similar NA sequences in cancer. The (1) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the protein. AAF68083 to AAF6898 and C expression and activity of the protein. AAF68083 to AAF6898 and concert invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention describes immunogenic portions of lung tumour-
csasociated proteins (I) and the nucleic acids (NAs) that encode them.
Cs. associated proteins (I) and the nucleic acids (NAs) that encode them.
Cs. (I) have cytostatic activity and can be used in gene therapy, antisense
cinhibition and in vaccines. The NAs and the lung tumour-associated
proteins they encode may be used in the prevention, treatment and
cindanosis of diseases associated with their inappropriate expression,
cspecially lung cancers. For example, the NAs may be administered to
treat diseases by rectifying mutations or deletions in a patient's genome
cc that affect the activity of the protein by expressing inactive proteins
cc or to supplement the patients own production of (I). Additionally, the
control of the protein by expressing inactive proteins
cc vandard recombinant DNA methodology. Conversely, antisense NA
concleouses may be administered to down regulate protein expression by
concleouses may be administered to down regulate protein expression by
concleouses may be administered to down regulate protein expression. The NA
and complementary sequences may also be used as DNA probes in diagnostic
cancer. The (I) may be used as antigens in the production of antibodies
cc and in assays to identify modulators (agonists and antengonists) of the
cxpression and activity of the protein. AAF68083 to AAF6808 and
conclude and protein sequences which are used in the exemplification
conclude and protein asquences which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
       Human; lung cancer; lung tumour; lung tumour protein; gene therapy; lung cancer antigen; lung tumour-specific antigen; diagnosis; vaccine; cytostatic; antisense inhibition; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lung tumor-associated proteins and the nucleic acids that encode them, useful for preventing, diagnosing and treating lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 595 GATTTGGGTTCCGGCGTCAAGGTGAAGATAATACCTAAAGAGGAACACTGTAAAATGCCA 654
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     292 GATTIGGGTTCCGGCGTCAAGTGAAGATAACTAAAGAGGAACACTGTAAATGCCA 351

The SESTS can have a range of activities depending on the tissues they were isolated from. The activities depending on the tissues they were isolated from. The activities include: chemotactic; proliferative: immunomodulatory; haematopoietic; chemotactic; antibacterial; antifundal; antiviral; antidiabetic; cytostatic; antibacterial; antifundal; antiviral; antidiabetic; antiasthmatic; vulnerary; antiulcer; osteopathic; neuroprotective: notropic; antiparkinsonian; antipsoriatic; cerebroprotective: anticorvulsant; and antidepressant. The SESTs can be used for gene interovalsant; and antidepressant. The SESTs can be used for gene identification and isolation of full-length cDNAs and genomic DNA molecules which correspond to the SESTs. Proteins encoded by the SESTs are useful in assays for determining biological activity and raising are useful in assays for determining biological activity and raising antipolaies. They may be useful for treatment of autoimmune disorders (multiple sclerosis, insulin dependent diabetes), allergic conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated polynucleotides, and encoded proteins, comprising secreted expressed sequence tags (SESTs), useful for treating various disorders such as autoimmune, infectious, and central nervous system disorders

(asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation disorders (haemophilia, thrombosis), inflammatory disorders (Crohn's disease), tumours, bacterial, fungal or viral infections, depression and psoriasis. AAA43420 to AAAA3425 represent linker variants which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is affilicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                598 ITGGGTTCCGGCGTCAAGGTGAAGATAATACCTAAAGAGGAACACTGTAAAATGCCAGAA 657
                                                                                                                                                                                                                                                                                                                                                     538 GCGACATGGAAGGTGATCTGCAAGAGCTGCATCAGTCAAACACCGGGGATAAATCTGGAT 597

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for screening full-length cDNA clones. The method comprises: (a) determining the base sequence in the 5'-region of each clone in a cDNA library; (b) examining and judging the presence/absence of initiation codon and its location in the determined 5'-region with a computer program for prediction; and (c) screening the initiation codon-carrying cDNA from the library. The method is useful in genetic engineering, e.g. for selective cloning, expression of full-length protein and functional analysis of isolated gene. The cDNA library contains full-length cDNA clones at extremely high ratio. The method of screening is highly selective and effective. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                      67 cresestrecretresescrateceasteceasascaceresaacecegacasaarre 126

No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer onns sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                  Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide useful as a marker for the diagnosis of breast cancer

The invention relates to the isolation of genes AAA59108-A59156 encoding 49 human secreted proteins AAB28012-B28060. The genes can be used to generate fusion proteins by linking to the gene for the human conformation of portion (SEQIDI) for increasing the stability of immunoglobulin G Fo portion (SEQIDI) for increasing the stability of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer. e.g. breast and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease multiple calonaria, and content cancers and content cancers and content cancers.
                                                                                                                                                     Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiahi; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAA45932 to AAA46016 represent human metastatic marker gene sequences.

The present invention describes: (1) isolated and purified human protein sequences encoded by AAA45932 to AAA4594; and (2) methods for detecting metastatic tumour cells and/or determining metastatic potential in a tissue sample. The metastatic parter polynucleotide sequence can be used as diagnostic agents for detecting metastatic tumour cells, determining metastatic potential in a tissue sample, propensity for the metastatic spread of a breast tumour preferentially to bone or lung, or the metastatic spread of a colon tumour. They can be used as markers of the metastasis and are useful for rationally prescribing the course of therapy for breast or colon cancer patients. Detection of metastatic marker gene expression is useful for e.g. identifying metastatic containing metastatic potential in a tissue sample, preferably a tumour. Appropriate treatment regimens can then be designed for patients who are at risk for developing metastatic cancers in other organs of the contemporatic anti-metastatic effect. Antibodies which pave a them etastatic markers can also be used to alter metastatic marker for the metastatic marker can also be used to alter metastatic marker for the metastat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, Activities cuch as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, hacmostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, as assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification.
                                                                  Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (1) and polypeptide (11) sequences. (1) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiersity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, such as lateral sci.rosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, atthritis and inflammation, leukaemias and construction activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Wang D;

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome concerns and gene mapping, and in recombinant production of (II). The chain reaction (PGR) primers, oligomers, and for chromosome concerns and in recombinant production of (II). The chain several production of (II). The concerns are also used in diagnostics as expressed sequence tags concerns activity of (II) or to treat disease states involving concerns and polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and (II) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical clasorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and animocals and products dependent nowell human

                                                                                                                                                                                                                                                                                                                                                                         The invention relates to new polynucleotides and polypeptides, useful for diagnosis and treatment of breast, lung and colon cancer. The sequences can be used in detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous. They can also be used to inhibit tumour growth by modulating expression of a gene product. AASJ8943-AASJ8318 represent novel human diagnostic and therapeutic coding sequences of the invention.

The invention comprises compositions used for the therapy and diagnosis of ovarian cancer. The compositions comprise one or more ovarian tumour of orderins, their associated polynucleotides, or immunogenic portions of proteins. The ovarian tumour polynucleotides and polypeptides are useful for stimulating and/or expanding T cells specific for a tumour compariant than an ovariant unmour DNA or protein by incubating isolated a patient with an ovariant unmour DNA or protein by incubating isolated T-cells allowing them to proliferate, and administering to the patient. The sequences can be used as markers for cancer, for example, to monitor ovarian cancer progression. Probes and primers are useful in nucleic acid ovariant sample, for preparing mutant species and for preparing other genetic constructions. Sequences AAS23820-AAS25231 and AAS25328-AAS25549 cepresent human ovarian tumour protein cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human ovarian tumour associated polynucleotide sequence SEQ ID NO:884.
New polynuclectides encoding ovarian tumour proteins, useful for treating ovarian cancer, and as probes, primers, and markers of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ovarian tumour; ovarian cancer; diagnosis; gene therapy;

coverexpression of functional CCYPR. Monoclonal or polyclonal antibodies to CCYPR may be used in enzyme-linked immunosorbent assays (ELISA) or radioimmunosasys to detect CCYPR. CCYPR itself may be used to detect compounds e.g., antibodies, oligonucleotides and proteins (receptors) that specifically bind to CCYPR. and in drug screening methods to identify compounds that modulate the activity of CCYPR. CCYPR nucleotides can be used to generate transgenic animal models of human disease, and can be used to generate transgenic animal models of human classes, and can be used to generate transgenic animal models of human disease, and can be used to generate transgenic animal models of human classes, and can be disorder associated with CCYPR. CYPR for the proteins, nucleic acids, agonists or antagonists include immune, developmental and cell signalling disorders, and cell proliferative developmental and cell signalling disorders, and cell proliferative disorders include anaemia, epilepsy, arteriosclerosis, asthma, cancer, allergies, include anaemia, epilepsy, arteriosclerosis, asthma, cancer, allergies, accounts the contractions of the menstrual cycle and infections

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a human NOV4 DNA. The NOVX protein has homology with one of G-antigen (GAGE)-like protein, interferon, G-protein coupled receptor (GPCR), hepatocyte nuclear factor or mast cell protease. The NOVX is useful for treating or preventing a pathology associated with NOVX. It is also useful for determining the presence or amount of NOVX DNA in a sample, for identifying a potential therapeutic agent and in predisposition to a disease associated with altered levels of NOVX. It is also useful for the diagnosis and treatment of proliferative disorders, also useful for the diagnosis and treatment of proliferative disorders, e.g., cancer, immune disorders, hepatic disorders, neurological disorders, e.g., bepatitis, neuroolfactory system related disorders, neurological disorders, e.g., Parkinson's disease, infertility,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation; ss.

                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL51717-ABL7017).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a
"Three-site aminoalkyl-derivatised
oligonucleotide with a 6-carbon linker arm
attached to an additional fluorophore molecule"
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

The probes comprise a segment complementary to the target nucleotide and are deapable of forming at least 1 imperfect hairpin. The probes contain at least one acceptor label moiety and at least one donor moiety label which are covalently attached to the nucleotide sequence so that when the hairpins are formed the moieties are in close proximity to allow resonance energy transfer between them. This causes a reduction in the fluoresence of the two fluorophores. The target sequence contains at target hybridisation. The hairpins formed are imperfect hairpins and the intentional base pair mismatches are introduced into the competitive target sequence. Therefore when the probe interacts with the target sequence. Therefore when the probe interacts with the target sequence the competitive arm is displaced, increasing the distance
                                                                                                                                                                                                                                                                                                                                                                                                                                                       between the fluorophores, resulting in a change in fluorescent emission.
  attached to an additional fluorophore molecule"
                                                                                                                                                                                                    Nucleic acid probe for use in DNA or RNA hybridisation assays comprises a nucleotide sequence which is capable of forming one

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful or and ovarian cancer and other cancers of the adrenal gland, bone, hone marrow, breast, gastrointestinal tract, liver, lung, or urogenital:

(b) immune disorders e.g. Addison's disease, allergies, autoimmune conting and parasitic contings (c) neurological disease, multiple sclerosis, rheumatoid arthritis and ulcerative disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial isothemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and cepture and parasitic infectious diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; nootropic; neuroprotective; cytostatic; dermatological; virucide; immunosuppressive; antiinflammatory; anti-HIV; antibacterial; vulnerary; antiparkinsonian; antisickling; antianaemic; antiarthritic; cancer; antirhemmatic; hepatotropic; cerebroprotective; antiinflammatory; antiallergic; antidiabetic; antiolicer; anticonvulsant; antidungal; antiparasitic; cardiant; immune disorder; cardiovascular disorder; neurological disease; infection; nephrotropic; gene therapy; vaccine; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
useful for preventing, diagnosing and/or treating nervous system
cancers and metastases .

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the genes are nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; SEQ ID NO 10258; 1701pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerss chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantiteting a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations
haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcertaive colitis; (c) cardiovascular disorders such as myocardial ischaemias; dol wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
cativity, and can be used in gene therapy and vaccine production. (I)
corrections and polynucleotides may be used in the prevention, diagnosis and
creatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
creatment of diseases associated with decreased
creatment of diseases associated with decreased
creatment of diseases associated with decreased
creatment they may be used to treat disorders associated with decreased
corrected the activity of (I) by expressing inactive proteins or to
cupplement the patients own production of (I). Additionally, (I)
corporated into a host cell and culturing the cell to express the
creances and cancer metastases of haematopoietic actived cells. AAK64703
corners and cancer metastases of haematopoietic antigen genomic
concers and cancer metastases of haematopoietic antigen genomic
concers and cancer metastases of haematopoietic antigen genomic
concers from the present invention. AAK54912 to AAK67950 and AAM82169
concers from the present invention. AAK54912 to AAK67950 and AAM82169

                                                                                                                                                                                                                                                                                                                                                                                                             AAZ79917 to AAZ80766 represent double stranded cDNA clones isolated from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The can a close can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acids, used to develop products for the diagnosis and treatment of disorders involving unwanted cell proliferation, particularly cancers, especially colon cancer

```

```
The sequences given in AAQ32850-56 encode bone morphogenetic proteins (BMP). BMP's increase bone growth and when used in conjunction with vitamin D the level of new bone growth is greater than when a BMP or vitamin D are used alone. The BMP's are administered for systemic treatment at a dose range of 1pg to 100 microg. BMP are active as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                        ö
                                                                                 A new method has been developed for generating new bone growth in a mammal. The method comprises administering a bone morphogenetic protein in combination with a vitamin D compound, where: (a) the bone morphogenetic protein is BMP-2 and is administered in an amount of 500-1000 ng in combination with about 6 ng vitamin D compound; or (b) the bone morphogenetic protein is BMP-4 and is administered in an amount of about 62.5 ng in combination with about 6 ng vitamin D compound. The present sequence encodes BMP-2. The method is used for treating bone defects or disorders, e.g. fractures, surgical lesions, periodontal disease, osteoporosis, arthritis and rickets.
                                                                                                                                                                                                                                                                                                                                                                                                                               Bone morphogenic protein; hBMP-2 class I; probes; cartilage formation; bone formation; osteogenic cpds; prodontal disease; ss.

The partial sequence is compiled from lambda U20S-39 and several other hBMP-2 class I cDNA recombinants.

This human cDNA hBMP-2 class I contains an open reading frame of 1188 bp, encoding a protein of 396 amino acids. The protein is preceded by a 5' untranslated region of 342 bp with stop codons in all frames. The 13 bp region preceding this 5' untranslated region receding this 5' untranslated region represents a linker used in the cDNA cloning procedures.
Sequence analysis of the strongly hybridising clones hBMP-2 class I (*BMP-2) indicated that they have extensive homology with the sequence given in AAN80622.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence was obtd. from clone lambda U2OS-39 (ATCC 40345) which was isolated from a cDNA library prepd. using human cell line U-2Os RNA. It is one of two classes of clones isolated distinguished by hybridisation characteristics. This class, designated hBMP-2A (previously BMP-2 and BMP-2 class I) hybridised strongly with the probe which was derived from the bovine BMP-2A sequence, and showed strong homology with that sequence. The second class, hBMP-2B (previously BMP-4 and BMP-2 Class II) hybridised only weakly and vis less homologous, esp. at the 3' end. The gene prod.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

is an oseteoinductive protein useful for inducing bone/cartilage repair, wound healing and tissue repair. Typical applications include healing of bone fractures; improved fixation of artificial joints; in cosmetic plastic surgery; and in treatment of periodontal disease, burns, inclains, ulcers etc. see also AAQ14035 and AAQ14037, AAQ14909 and AAQ14910.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A human UZOS cDNA library was screened with a bovine BMP-2A probe (see AAQ31868). Sequence analysis of strongly hybridising clones designated hBMP-2A (previously designated BMP-2 and BMP-2 Class I) indicated that they have extensive homology with the partial bovine BMP-2A sequence; weakly hybridising clones were designated hBMP-2B (previously designated BMP-4 and BMP-2 Class II) and sequence analysis indicated these clones were quite homologous with the
                                                                                                                                                                                                                                                                                              Morphogenic Protein; bacteriophage lambda U20S-39; ATCC 40345; fracture; cartilage defect; osteoporosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA encoding osteo-inductive proteins - used for producing {\tt BMP-2A} and {\tt BMP-2B} for inducing bone or cartilage formation and wound

The sequence is that encoding the human bone morphogenetic protein BMP-2. It may be used in the prodn. of a recombinant heterodimeric protein having bone stimulating activity. This heterodimer is encoded by a sequence encoding BMP-2 or a fragment and a Sequence encoding a second protein or fragment selected from BMP-5, BMP-6, BMP-7 or BMP-8. It may be used in compsns. for wound healing, tissue repair, and in similar compsns. which have been indicated for the repair, and in similar compsns. which have been indicated for the individual BMPs may permit lower dosages to be administered. A heterodimeric protein which induces cartilage and/or bone growth in circumstances where bone is not normally formed, has applications in the healing of bone fractures and cartilage defects in humans and other animals. The heterodimer may have prophylactic use in humans and other animals. The heterodimer may have prophylactic use in humans and other animals. The heterodimer may have prophylactic use in nuclosed as well as open fracture reduction and also in the improved fixation of artificial joints. De novo bone formation induced by an osteogenic agent contributes to the repair of
                                                                                                                                                                                                                                                                                    ó

congenital, trauma induced or oncologic resection induced craniofacial defects, and also is useful in cosmetic plastic surgery. It may be used in the treatment of periodontal disease and in other tooth repair processes. It may also be useful in the treatment of costeoporosis, wound healing (e.g. burns, inclisions and ulcers) and related tissue repair, and may increase neuronal survival and be useful in the transplantation and treatment of conditions exhibiting a decrease in neuronal survival. It may be combined with other agents beneficial to the bone and/or cartilage defect, wound or tissue in question, e.g. EGF, PDGF, TGF-alpha, TGF-beta and insulin-like growth factor
                                                                                                                                                                        Gaps

The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAs) that encode them.

(I) have cytostatic activity and can be used in gene therapy, antisense (I) have cytostatic activity and can be used in gene therapy, antisense control of diseases The NAs and the lung tumourassociated adjances of diseases associated with their inappropriate expression, control of diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the CNAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA molecules may be administered to down regulate protein expression by concludementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar NA sequences in cancer. The (I) may be used as antigens in the production of antibodies and an assays to identify modulators (agonists and antagonists) of the expression and activity of the protein. Apr86803 to AAB768878 represent human lung tumour protein related

The invention relates to new polynucleotides and polypeptides, useful for diagnosis and treatment of breast, lung and colon cancer. The sequences can be used in detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous. They can also be used to inhibit tumour growth by modulating expression of a gene product. AAS30943-AAS30338 represent novel human diagnostic and therapeutic coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cancer; breast; lung; colon; prostate; cytostatic; diagnostic; ss.

potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be treasner of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy.

The GENSET polypeptide may be used as antispens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; lung cancer; lung tumour; lung tumour protein; gene therapy; lung cancer antigen; lung tumour-specific antigen; diagnosis; vaccine; cytostatic; antisense inhibition; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAs) that encode them.

[1] have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumour associated proteins they encode may be used in the prevention, treatment and alganosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the NAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA molecules may be administered to down regulate protein expression by indiany with the cells own genes and preventing their expression by and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar NA sequences in samples, and hence which patients may be in need of treatment for lung cancer. The (I) may be used as antiques in the production of antipodies and in assays to identify modulators (agonists and antagonists) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAS) that encode them.

(I) have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAS and the lung tumour associated proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAS may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the NAS may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA molandistered to down regulate protein expression by binding with the cells own genes and preventing their expression. The NAS and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar NA sequences in samples, and hence which patients may be in need of treatment for lung cancer. The (I) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the

The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity.

(I) have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumour associated proteins they encode may be used in the prevention. Treatment and diagnosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the NAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA molecules may be administered to down regulate protein expression by binding with the cells own genes and preventing their expression. The NA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar NA sequences in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            samples, and hence which patients may be in need of treatment for lung cancer. The (1) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the protein. AaF68083 to AaF68878 and AAB76848 to AAB76848 represent human lung tumour protein related nucleotide and protein sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lung tumor-associated proteins and the nucleic acids that encode them, useful for preventing, diagnosing and treating lung cancer \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  64 GACACGCGGACACACACAAAACACAGACCACACACACAGTCCCAGGAGCCCAGTAATGG 123

The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAs) that encode them.

(I) have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumourassociated proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the NAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lung tumor-associated proteins and the nucleic acids that encode them, useful for preventing, diagnosing and treating lung cancer -

molecules may be administered to down regulate protein expression by binding with the cells own genes and preventing their expression. The NA and complementary sequences may also be used as DNA probes in diagnostic sassays to detect and quantitate the presence of similar NA sequences in samples, and hence which patients may be in need of treatment for lung cancer. The (I) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the ARP76848 to AAB76878 represent human lung tumnour protein related nucleotide and protein sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       breast; lung; colon; prostate; cytostatic; diagnostic; ss.

                                                                                                                         diagnosis and treatment of breast, lung and colon cancer. The sequences can be used in detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a differentially expressed gene product. They can also be used to inhibit tumour growth by modulating expression of a gene product. AAS36943-AAS39338 represent novel human diagnostic and therapeutic coding

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for screening full-length CDNA clones. The method comprises: (a) determining the base sequence in the presence of each clone in a CDNA library: (b) examining and judging the presence/absence of initiation codon and its location in the determined 5'-region with a computer program for prediction; and (c) screening the initiation codon-carrying CDNA from the library. The method is useful in genetic engineering, e.g. for selective cloning, expression of full-length protein and functional analysis of isolated gene. The CDNA library contains full-length CDNA clones at extremely high ratio. The method of screening is highly selective and effective. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elatin. to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nemanopolesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypucleotide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyofrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, Activities such as Immune system suppression, Activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C.N.S disorders.

The NOVX protein has homology with one of G-antiquen (GAGE)-like protein, interferon, G-protein coupled receptor (GPCR), hepatocyte nuclear factor or mast cell protease. The NOVX is useful for treating or preventing a pathology associated with NOVX. It is also useful for determining the presence or amount of NOVX pan is a sample, for identifying a potential therapeutic agent and in gene therapy. It is also useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX. It is also useful for into a disease associated with altered is of or predisposition to a disease associated with altered levels of NOVX. It is also useful for the diagnosis and treatment of proliferative disorders, e.g., hepatlis, neuroolfactory system-related disorders, authorizing neurological disorders, e.g., parkinson's disease, infertility, autoimmune diseases, arthritis, multiple sclerosis, allergies and wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          429 GAGCCCAGTAATGGAGAGCCCCAAAAAGAACCAGCAGCAGCTGAAAGTCGGGATCCTACA 488

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The colonical production of (II) and for identifying expressed genes. (I) is useful in gene therapy techniques for restore normal activity of (II) or to treat disease states involving constituting a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in che produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. AAS6419-AAS94564 represent novel human configuration, but was obtained in electronic format directly from WIPO

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA ibraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore bused to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with notropic, immunosuppressant and cytostatic acitvity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, as assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                           concerning to many stars represent specializatly distanced septressed expressed tissues to many stars represent means of activities depending on tissue sources. The sESTS can have a range of activities depending on tissue study were isolated from. The activities include: chemotactic; proliferative; immunomodulatomy; haematopoietic; chemotactic; proliferative; immunomodulatomy; haematopoietic; chemotactic; proliferative; immunomodulatomy; antidiabetic; chemotactic; antibacterial; antifungal; antiviral; antidiabetic; chemotopic; antibacterial; antifungal; antiviral; antidiabetic; antibacterial; antidicer; osteopathic; neuroprotective; contropic; antiparkinsonian; antiposoriatic; cerebroprotective; anticonvulsant; and antidepressant. The sESTS can be used for gene therapy and in vaccines. The sESTS are useful as probes for the anticonvulsant; and antidepressant. The sESTS can be used for gene therapy and in vaccines of the sESTS are useful as probes for the molecules which correspond to the sESTS. Proteins encoded by the sESTS are useful in assays for determining biological activity and raising antibodies. They may be useful for treatment of autoimmune disorders (astuma), mysold or lymphoid cell deficiencies, wounds, burns, ulcers, catchers (haemophila, thrombosis), inflammatory disorders costeoporosis, osteoarthritis, central nervous system disorders costeoporosis, bacterial, fungal or viral infections, depression and disorders (haemophila, thrombosis), inflammatory disorders (conditions) disorders (haemophila, thrombosis), inflammatory disorders (conditions) disorders (haemophila, thrombosis), inflammatory disorders (conditions) disorders (haemophila, fungal or viral infections, depression and psoriasis. AAA43420 to AAA43425 represent linker variants which are given in the exemplification of the present invention.

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, complying the propertion (PCR) primers, oligomers, and for chromosome or polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The configuration are also used in diagnostics as expressed sequence tags complying expressed genes. (I) is useful in gene therapy techniques contourned activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving contourned and polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations composition of sequences.
